

# Declaration

## Declaration to PFAS

Per- and polyfluoroalkyl substances (PFAS) are new substances of concern in products. PFAS are a group of chemicals that include PFOA, PFOS and other chemicals that have been used to manufacture everyday household products since the 1940s.

Per- and polyfluorinated alkyl compounds (PFAS) are a group of man-made and widely used chemicals that can accumulate over time in human tissues and the environment. They are known as "persistent" or "persistent" chemicals because they can be detected in our environment and bodies for extremely long periods of time. They can lead to health problems such as liver damage, thyroid disease, obesity, fertility problems and cancer.

For this reason, many governments are taking measures to restrict the use of these substances in products.

According to the information currently available to us, we do not intentionally use PFAS substances in the manufacture of the cables supplied to our customers. Our products do not knowingly contain any hazardous substances from the PFAS group.

This information represents Kabelwerk Eupen AG knowledge and belief as of the date that it is provided.
